

QUANTUM RESOURCES FOR COMPUTING

SUPERPOSITION

Quantum objects can be in two states at once. You won't know the state until gou make a measurement.

ENTANGLEMENT

Is a quantum correlation between objects where the state of one quantum object depends on the state of the other.

INTERFERENCE

Two quantum objects can interact with each other or and either cancel each other out or amplify one another.

These three weird properties enable the design of quantum algorithms which can compute in ways classical computers cannot, making quantum computers more powerful for solving certain types of problems

"Quantum objects can be in two states at once"

SUPERPOSITION

SUPERPOSITION:

a qubit can be 0 and 1 at the same time

This is how we show it:

 $|\psi\rangle = \alpha|0\rangle + \beta|1\rangle$

MEASUREMENT

MEASUREMENT:

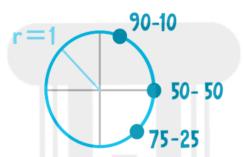

collapses the quantum state of the qubit $|\Psi\rangle$ to either $|0\rangle$ or $|1\rangle$

probability of me. |0> : |a|2

probability of me. $|1\rangle : |\beta|^2$

 $|a|^2 + |\beta|^2 = 1$

There are continuous set of

50-50 superposition of 0 and 1

$$|\psi\rangle = \sqrt{0.5} |0\rangle + \sqrt{0.5} |1\rangle$$

$$Q = \sqrt{0.5} = |Q|^2 = 0.5$$

$$\beta = \sqrt{0.5} = |\beta|^2 = 0.5$$

75-25 superposition of 0 and 1

 $|\Psi\rangle = \sqrt{0.75} |0\rangle + \sqrt{0.25} |1\rangle$

$$a = \sqrt{0.75} = |a|^2 = 0.75$$

$$\beta = \sqrt{0.25} = |\beta|^2 = 0.25$$

QUANTUM BITS: QUBITS

"How quantum computers compute"

BIT to QUBIT

in	out
0	0>
-4	1.4

> is a ket and it indicates that we are talking about quantum states.

WHY ARE QC FASTER

# OF QUBIT	# OF SUPERPOS. ST.
1	2 (10>,11>)
2	4 (100101110111\)
3	8

n qubits — 2ⁿ superposition states Each operation acts on all the elements

of the superposition

TWO QUBITS

Let's say we have two qubits: A and B

| 100 or | 10 > 10 > qubit $A \rightarrow 10$ > qubit $B \rightarrow 10$ >

|01> or |0>|1> qubit A \rightarrow |0>

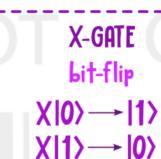

qubit $B \rightarrow |1\rangle$

|10> or |1>|0> qubit A \rightarrow |1> qubit $B \rightarrow 10$

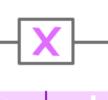

|11> or |1>|1> qubit $A \rightarrow |1>$

qubit $B \rightarrow |1\rangle$

QUANTUM GATES: SINGLE-QUBITS

 $X|1\rangle \rightarrow |0\rangle$

Z-GATE phase gate **7 |0⟩→|0⟩** $|Z|1\rangle \rightarrow -|1\rangle$

_____**Z**}-

in	out
0>	0>
1>	- 1>

HADAMARD creates 50-50 superposition

 $H |0\rangle \rightarrow \sqrt{0.5} |0\rangle + \sqrt{0.5} |1\rangle$ $H|1\rangle \rightarrow \sqrt{0.5}|0\rangle - \sqrt{0.5}|1\rangle$

QUANTUM GATES applied to superposition

Quantum gates apply to each state of the superposition

 $\chi|\psi\rangle = \chi(\alpha|0\rangle + \beta|1\rangle$ $= a(X|0\rangle) + \beta(X|1\rangle)$ $=a|1\rangle+\beta|0\rangle$

What is the difference between a coin flip and quantum

1 coin flip: 50%H 50%T 2 coin flip: 50 % H 50 % T

SUPERPOSITION

1 had gate: measu > 50 % 0 50 % 1 2 had gate: measu. > 100% 0

The states involved in quantum superposition can

QUANTUM ENTANGEMENT "Quantum correlation between two qubits where the state of one qubit depends on the other qubit"

ENTANGLEMENT

If we measure | Ψ \right\rangle

Entangled state: $|\psi\rangle = \sqrt{0.5} |00\rangle + \sqrt{0.5} |11\rangle$ What if we only measure qubit A?

* we get 100 with 50% probability

* we get |11> with 50% probability

If qubit A is 0 the quantum state of qubit B is mmediately set to 10>

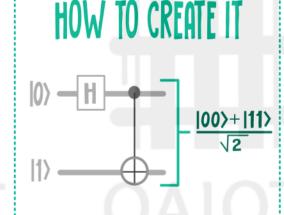

If qubit A is 1 quantum state qubit B set to 11>

APPLICATIONS

- * Quantum teleportation
- * Quantum cryptography
- * Superdense coding
- * Quantum speedups

Q. TELEPORTATION

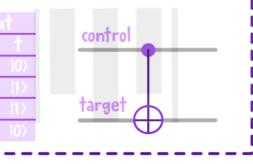

Transferring information or matter from one point to another without physically moving things!

QUANTUM GATES: TWO QUBITS

CNOT gate (controlled not)

- *If the control qubit is 0, does nothing
- *If the control qubit is 1, flip the target qubit

A programmable quantum device can solve a problem that no classical computer can solve in any feasible amount of time
